

## **Rough Terrain Forklift**

Used Rough Terrain Forklift Santa Ana - Broadly defined, a forklift truck uses two forks to load, transport and unload material. The two main categories of forklifts are industrial forklift and rough terrain forklift. Ideal for working on surfaces that are level and smooth, industrial forklifts are mostly utilized for warehouse applications and loading dock situations. Rough terrain forklifts are better suited for rocky environments and uneven surfaces. Due to size, tires, and weight capacity, a rough terrain lift is primarily used outdoors, often at construction sites. The tire type is one of the key differences between rough terrain and industrial forklift units. Common road tires, cushion tires are the main kind found on industrial forklifts. Rough terrain models rely on pneumatic tires, a kind of tractor tire known for better floatation and traction abilities. Industrial forklifts can be powered by internal combustion engines but are more frequently powered by an electrical source, such as battery or fuel cell whereas rough terrain forklifts are almost always powered by an internal combustion engine.

### Types of Class 7 Rough Terrain Forklift Trucks

The three types of Class 7 Rough Terrain Forklift Trucks include the rotating telehandler forklifts, telehandler forklifts and straight mast forklifts. Every rough terrain forklift truck is designed to operate on disturbed ground and difficult locations commonly found in military and construction atmospheres. A rough terrain forklift also offers increased maneuverability and performance. In the case of rough terrain forklift operations, extra consideration must be given while raising loads in these rough, variable conditions to prevent tip-over. For safety reasons, it is vital the forklift maintains stability before moving, lifting or lowering. Rough terrain forklift operators must practice correct lifting techniques to remain stable on the ground.

### Straight Mast Forklifts

The straight mast forklift design enables easy transport around rough terrain locations including construction and demolition sites. Pneumatic cushion tires allow this forklift better maneuverability and accessibility around difficult terrain. Pneumatic tires allow the machine to successfully traverse difficult terrain. The majority of straight mast forklifts come in both two wheel and four wheel drive capabilities. Even though these machines are better utilized in exterior locations, many straight mast forklifts operate with propane or diesel, enabling them to be used indoors for short timeframes. The lift capacities of straight mast forklifts are similar to most standard forklifts with a range of approximately 5,000 to 36,000 pounds.

### Telehandler or Telescopic Handler Forklifts

The distinct telescoping boom on telehandlers and telescopic handler forklifts contribute to the unit's name. This specially designed boom allows the forklift truck to pick up loads and place them at differing heights in front of the unit. Better reachability delivers greater flexibility to the forklift operator while placing loads. A standard telehandler forklift is long and low, with two wheels at the very front of the forklift and another pair of wheels toward the rear of the machine. Mounted at the back of the forklift, the telescopic boom is on a pivot that is located many feet above the forklift frame. The hydraulic fluid tank and fuel tank are mounted on the opposite side of the cab which is usually situated on the left side of the forklift. Along the center of the machine, the engine and transmission can be found inside the frame. This popular design showcases a balanced forklift which is ideal for the machine's stability with lifting, moving and lowering items. Compared to standard forklifts, telehandlers deliver higher lift heights. Also called compact telehandlers or high-reach telehandlers, these forklift trucks can lift their full load capacities from 18 feet, for the compact telehandlers, to 56 feet, for the high-reach telehandlers, into the air. The load capacities of these machines range from five thousand pounds to twelve thousand pounds. All-wheel steering is popular for all-terrain forklifts and provides increased maneuverability. Thanks to steering features including power-shift transmission, the operator can maneuver the machine in excellent proximity to the work location. More recently, Telehandler forklift models have included additional features that incorporate the latest in ergonomics. These features include tilted steering options and roomier cabs to increase operator comfort. High in demand at job sites, these ergonomic options reduce operator fatigue and repetitive stress injuries. Most telehandler forklifts rely on a single joystick. The joystick is responsible for the hydraulic system and

the boom operations. Telehandler forklifts can also be equipped with non-marking tires which allow them to be used in other applications such as the installation of signs and billboards as well as maintenance on buildings and stadiums. Rotating Telehandler or Roto Telescopic Handler Forklifts Roto telescopic handler forklifts or rotating telehandlers have numerous items in common with the standard telehandler model. Telehandlers are capable of rotating heavy-lift weights to tremendous heights. However, these forklifts have the added ability to rotate the forklift on a turntable. The rotating function allows the forklift to swivel a full 360 degrees around, enabling access a much larger work area without having to reposition the forklift. With rotating telehandlers, one joystick handles the lift capacity and a second joystick is responsible for the rotation factor. Power-assist steering minimized slip differential on the rear axle for additional traction and four-wheel drive are some of the extra features offered on rotating telehandlers and standard telehandler models. Of course, a machine that can rotate has extra safety considerations to understand. Because of this, rotating telehandler rough terrain forklifts come with stabilizers to increase the safety when rotating loads from one side of the forklift to the other. Some rotating telehandlers do not have stabilizers. These units are created to move and work in various aspects of the job site and are easier to reposition without stabilizers. Rotator telehandlers are usually smaller than their fixed cab counterparts, the standard telehandler. Because of this, their load capacities are also smaller than the standard telehandler. Ranging between four thousand and ten thousand pounds, rotating telehandlers can reach lift heights from 15 to 80 feet. Winch attachments can transform rotator telehandlers and standard models into a crane. These units can enable job sites that require a crane to get the job done without having to rent and transport a separate machine. Advancements for Rough Terrain Forklifts Numerous attachments can be found for rough terrain forklifts including articulating booms, rotating fork carriages, booms, winches and similar items. Because of the importance of forklift attachments in their ability to adapt forklifts to many different types of specific jobs, it is expected that the creation and availability of new rough terrain forklift attachments will continue to increase. Most of the proposed advancements will consist of included safety features within the rough terrain forklifts. Automatic load restriction units and certain safety features have started being implemented. These systems automatically weigh a load and then calculate the safe reach distance of that load, taking into consideration the angle and extension of the boom. An alarm sounds once the safe distance is reached, warning the operator to make load weight, reach distance or boom angle adjustments.
